This the continuation of module 4 sales app , this includes protected routes which wont allow user to access any other page before registering and than logging in by saving token in local storage in auth , Ive used jwt token , and bycrpyt

. The jsonwebtoken creates a token in which you can user details before sending it to the frontend or browser for storing in local storage after logging in ,

 the bycript using salt helps you in salting the users password therefore the password cannot be seen by database handler .

  In other pages like addsales you can add the details of the sale , in todays highest revenue you can see the subtotal revenue of all sales , and than in in top five sales you can see top 5 sales with highest amount arranged from highest to lowest .
